

Managing Environments

The Cantara Administration Console allows you to set up as many environments as you need to manage your data on the JD Edwards server. For example, you can create three separate environments for development, testing, and production; typical cycles in a JD Edwards ERP project lifecycle.

When you create an environment, you have the option of allowing the Cantara Access Server to access and load the media object queues on the JD Edwards server.

The following topics provide specific details related to managing environments:

- [Defining an Environment](#)
- [Deleting an Environment](#)
